Case No. 3:24-cv-02596

COMPLAINT

INTRODUCTION

1. Plaintiff Professor Ethan Zuckerman seeks to release a browser extension that would give Facebook users greater control over their platform experience, and enable them to join an academic research study exploring the impact of that increased control on user behavior and well-being. The tool, called Unfollow Everything 2.0, would allow users to unfollow their friends, groups, and pages, and, in doing so, to effectively turn off their newsfeed—the endless scroll of posts that users see when they log into Facebook. Users who download the tool would be free to use the platform without the feed, or to curate the feed by refollowing only those friends and groups whose posts they really want to see. Professor Zuckerman has not launched this project because, when another developer released a similar tool called Unfollow Everything, Defendant Meta Platforms, Inc. threatened that developer with legal action. Professor Zuckerman files this suit to obtain a judicial declaration that Unfollow Everything 2.0, as described below, is immunized from legal liability by Section 230 of the Communications Decency Act. In the alternative, he seeks a declaration that the tool does not violate Meta’s Terms of Service, the Computer Fraud and Abuse Act, or California’s Computer Data Access and Fraud Act.

2. Ethan Zuckerman is the director of a research center that is dedicated to building a more civic-minded internet, and an associate professor at the University of Massachusetts Amherst. He has a longstanding interest in building tools that empower social media users to better control their online experiences. As Professor Zuckerman’s scholarship observes, users today are locked in to a social media ecosystem dominated by a handful of for-profit companies that make their money by selling ads. The companies do this by collecting vast amounts of data about their users and using this information to make their platforms as engaging as possible. There is rising public concern that this business model undermines users’ agency and harms public discourse. For example, many experts argue that the platforms’ engagement-driven algorithms contribute to the spread of false, extreme, or polarizing content, while also stoking division and violence offline. Many users want more control over their social media experiences, but the companies have largely refused to give it to them. Professor Zuckerman believes that third-party tools that operate at the explicit direction of their users can help resolve this impasse. Such tools would enable users to

1 tailor what they see on social media to their own preferences—and to take back control over their
2 social media experiences.

3 3. As a general matter, the social media companies may design their products as they
4 wish. Through Section 230 of the Communications Decency Act, however, Congress sought to
5 empower and encourage individuals, families, and schools to “self-police” the information they
6 receive online. *Batzel v. Smith*, 333 F.3d 1018, 1028 (9th Cir. 2003). Thus, Section 230(c)(2)(B)
7 immunizes from legal liability “a provider of software or enabling tools that filter, screen, allow,
8 or disallow content that the provider or user considers obscene, lewd, lascivious, filthy, excessively
9 violent, harassing, or otherwise objectionable.” *Zango, Inc. v. Kaspersky Lab, Inc.*, 568 F.3d 1169,
10 1173 (9th Cir. 2009). Through this provision, Congress intended to promote the development of
11 filtering tools that enable users to curate their online experiences and avoid content they would
12 rather not see.

13 4. Unfollow Everything 2.0 fits comfortably within this safe harbor: by allowing users
14 to turn off their newsfeed, it would enable them to block content they do not want to see, while
15 allowing them to stay connected with friends and family. That is because unfollowing friends,
16 groups, and pages has the effect of removing content generated by these sources from a user’s
17 feed, but not from a user’s directory. Users would remain free to navigate to their friends’ profiles,
18 but without first being presented with a feed that Facebook has designed to maximize user
19 engagement. There are many reasons users might want to use Facebook without the newsfeed.
20 Many users want to reduce the amount of time they spend on the platform. Others object to the
21 way the feed is sorted, because they fear that an engagement-driven feed tends to promote content
22 that is sensationalist or inflammatory. Still others would like to curate their feed to show only
23 content they really want to see.

24 5. Unfollow Everything 2.0 would work by automating a feature that Facebook itself
25 provides. Facebook allows users to manually unfollow friends, groups, and pages, but doing so for
26 hundreds or even thousands of friends, groups, and pages is cumbersome and time-consuming.
27 Unfollow Everything 2.0 streamlines the process, while protecting user privacy.
28

6. Using Unfollow Everything 2.0, Professor Zuckerman plans to conduct an academic research study of how turning off the newsfeed affects users' Facebook experience. The study is opt-in—users may use the tool without participating in the study. Those who choose to participate will donate limited and anonymized data about their Facebook usage. The purpose of the study is to generate insights into the impact of the newsfeed on user behavior and well-being: for example, how does accessing Facebook without the newsfeed change users' experience? Do users experience Facebook as less “addictive”? Do they spend less time on the platform? Do they encounter a greater variety of other users on the platform? Answering these questions will help Professor Zuckerman, his team, and the public better understand user behavior online and the influence that platform design has on that behavior.

7. The tool and study are nearly ready to launch. But Professor Zuckerman has not launched them because of the near certainty that Meta will pursue legal action against him for doing so. Unfollow Everything 2.0 is modeled on an earlier tool called Unfollow Everything, which also allowed users to automate the process of unfollowing their friends, groups, and pages to turn off their newsfeeds. In July 2021, Meta (then Facebook) sent the developer of Unfollow Everything a cease-and-desist letter threatening him with legal action unless he took the tool down, which the developer did. Professor Zuckerman is unwilling to risk being sued. As a result, he will not be able to launch Unfollow Everything 2.0 unless and until a court rules that the tool is protected by Section 230 of the Communications Decency Act, or that the tool does not violate Meta's Terms of Service, the Computer Fraud and Abuse Act, or California's Computer Data Access and Fraud Act.

JURISDICTION AND VENUE

8. This Court has subject matter jurisdiction over this action under 28 U.S.C. § 1331 and 28 U.S.C. § 1367, because this Complaint asserts claims arising under the laws of the United States and the remaining state law claims form part of the same case or controversy under Article III of the U.S. Constitution. This Court may award Plaintiff declaratory relief pursuant to 28 U.S.C. §§ 2201–2202.

1 news, and participate in public and political life. The companies' platforms are the infrastructure
2 for much of the speech that is important to our democracy. According to a recent study conducted
3 by the Pew Research Center, roughly seven in ten Americans use social media. YouTube and
4 Facebook dominate the landscape, with 81% and 69% of Americans, respectively, using those
5 sites. Most of those users visit the sites frequently. For example, seven in ten Facebook users visit
6 the site daily, including 49% who say they visit the site several times a day. Forty three percent
7 say they regularly get news from Facebook.

8 16. The dominant social media companies are in the business of selling ads. They
9 attract users to their platforms with a variety of content and features, and then they market their
10 users' attention to advertisers. On Facebook, for example, advertisers can pay to have their
11 products or political messages appear, or appear more prominently, in the newsfeeds of the
12 platform's users. Facebook allows its advertisers to target their ads very precisely—for example,
13 by displaying the ads to individual users based on the thousands of characteristics that Facebook
14 infers about those users. This business has been enormously lucrative. Last year, Meta, which owns
15 Facebook and Instagram, made over 134 billion dollars, with close to 98% of that revenue coming
16 from the sale of ads. In the same period, Google generated over 237 billion dollars from ads.

17 17. The social media companies have been so successful because they are exceptionally
18 good at keeping their users on their platforms. They do so by making the platforms as engaging as
19 possible. And they make their platforms engaging by individualizing the experience of each user.
20 The platforms conduct pervasive surveillance of their users, and they use the data they collect to
21 train machine-learning algorithms to predict which content is most likely to attract and keep the
22 attention of their users. The process is continuous, with users spending more time on the platforms
23 and, as a result, generating more data that the platforms capture and use to refine their engagement-
24 maximizing algorithmic predictions.

25 18. There is increasing public concern that this business model is having deleterious
26 consequences for public discourse and society. Researchers hypothesize, for example, that the
27 companies' platforms have fueled the spread of misinformation and hate speech, produced
28 ideological feedback loops that push users to more extreme and sensational content, exacerbated

1 political polarization, and incited real-world violence. There is also mounting evidence that the
2 companies' thirst for user engagement produces misaligned incentives. For example, in 2021, Meta
3 whistleblower Frances Haugen testified to Congress that, although the company's own research
4 shows that Facebook users gravitate to harmful content, the company's feed-ranking algorithm
5 continues to prioritize whatever keeps users on the platform, at the expense of user safety.

6 19. Despite widespread concern over the harms caused by the dominant companies'
7 business model, alternative social media platforms struggle to compete. One reason for this is the
8 "network effect"—the phenomenon by which the value of a product or service increases as more
9 people use it. Social media platforms benefit from the network effect because users generally
10 prefer to use the platforms their friends and family use. This preference creates a positive feedback
11 loop where the more users a platform has, the more users it is likely to attract.

12 20. High "switching costs" also favor the dominant social media companies by making
13 it more costly for users to switch between platforms. The companies drive up these costs in several
14 ways. For example, they incentivize users to entrust more and more of their personal data to them
15 without allowing users to easily transfer that data elsewhere. They also restrict the ability of users
16 and competitor services to "interoperate" with their platforms. Third-party developers are
17 generally unable to programmatically access the data and functionality necessary to create services
18 that would allow users of one platform to interact with users of another. And developers that
19 attempt to do so outside the limited bounds of permissioned access that some companies provide
20 face legal threats. The result is that users are generally unable to leave a platform without losing
21 the communities, connections, and content they forged there.

22 **II. Despite the centrality of the dominant social media platforms to our lives, users have**
23 **little agency on them.**

24 21. Platform users have little control over their online social media experiences because
25 the companies generally don't give users much control. Instead, the companies retain for
26 themselves control over the key features of their platforms. They decide, for example, who can
27 join, what can be said, and what will be heard. They decide what the interfaces look like, what
28 kinds of experiences to encourage, and what kinds of experiences to discourage. They decide

1 whether and where to place ads, whether to promote sensational content or informative content,
2 whether to nudge their users into ideological silos or to expose them to the plurality of society.

3 22. Crucial to the companies' control over their users' experiences is their reliance on
4 algorithms to rank content in each user's feed. To a very significant degree, these ranking
5 algorithms determine what content users see and interact with on the platforms. In a 2018
6 interview, the director of analytics for Facebook's newsfeed estimated that the average user has
7 about 2,000 stories in their feed every day but scrolls through only about the first 200 of them.
8 Facebook decides which stories its users see, because Facebook decides the order in which they
9 appear. The other dominant social media companies similarly decide what their users see.

10 23. The companies use their ranking algorithms to make their platforms more engaging
11 and to keep users on the platforms for longer. Again, Facebook is a case in point. Meta's own
12 studies have shown that users spend less time on the site, and log in less often, when the algorithms
13 that rank each user's feed are turned off. A recent independent study that investigated the effects
14 of Facebook's and Instagram's algorithms during the 2020 U.S. election confirms these findings.
15 The paper, published in 2023 in the journal *Science*, compared time spent on the platform while
16 using the default ranking algorithm to time spent on the platform while using a reverse
17 chronological feed, and found that users with a reverse chronological feed spent "dramatically
18 less" time on Facebook and Instagram.

19 24. Despite the importance of the companies' ranking algorithms, many users do not
20 understand the role they play in shaping their online lives. For example, a study conducted by the
21 Pew Research Center in 2018 found that over half of U.S. adults who use Facebook say they do
22 not understand why certain posts but not others are included in their feed, with over 20% saying
23 they do not understand the feed at all. Reinforcing this conclusion, a Pew survey published the
24 next year found that 74% of U.S. adult users did not know that the platform categorized their
25 interests and traits, and roughly half were uncomfortable with Facebook compiling this
26 information. This lack of understanding deprives users of the opportunity to make informed
27 choices about their use of social media.

1 25. A growing body of research has found that users want more agency over their social
2 media experiences. Users who lack this agency report feeling dissatisfaction and even a sense of
3 injustice. For example, a 2021 study of YouTube found that features like autoplay and
4 recommendations undermined users' sense of agency by "prompt[ing] or pressur[ing] [them] with
5 suggestions that were difficult to decline." Participants expressed frustration at existing
6 customization settings and said they "wanted more opportunities to make active choices, rather
7 than respond to a set of choices proposed by the app."

8 26. Studies of Facebook users have similarly found that users want more control over
9 their experiences. For example, more than half the participants in one recent study stated that
10 Facebook's feed "did not give them what they wanted, and they desired easy ways to filter, limit,
11 and turn it off." The study noted that, although some participants had tried customizing their feeds,
12 they found "Facebook's means of doing so tedious and ineffective." A survey conducted by Pew
13 Research in 2018 echoes these findings: the survey found that only 14% of Facebook users believe
14 ordinary users have a lot of control over the content that appears there, and twice that number
15 (28%) feel they have no control.

16 27. Evidence suggests that a lack of agency over their social media experiences may
17 lead to concrete harms in users' lives. For example, the *Wall Street Journal* has reported that
18 researchers on Facebook's well-being team found that one in eight users reported "engaging in
19 compulsive use of social media that impacts their sleep, work, parenting or relationships." These
20 problems include "a loss of productivity when people stop completing tasks in their lives to check
21 Facebook frequently, a loss of sleep when they stay up late scrolling through the app and the
22 degradation of in-person relationships when people replace time together with time online."

23 28. Though many large platforms claim to provide tools that empower users, these tools
24 often fail to afford users meaningful control, and in some cases even induce users to act against
25 their own interests. For example, a recent study by Simply Secure described YouTube's user
26 controls as a "maze of loops, deadends, and never-ending paths," raising the concern that some of
27 the company's design choices were "intentionally deceptive." The problems the study identified
28 were legion: there was nothing users could control on the "settings" page; controls were "reactive

1 and not proactive, leaving users to catch-up to the recommendation engine rather than designing
2 what they want to see”; accessing controls was convoluted; options for teaching the algorithm were
3 limited; and the words used to describe the outcome of each step a user could take were vague. A
4 study by Mozilla of over 30,000 users confirmed that users were generally not satisfied with
5 YouTube’s user controls; many were left feeling frustrated and confused.

6 **III. Third-party tools are crucial to increasing user agency on the platforms, but the**
7 **companies continue to frustrate their creation.**

8 29. Historically, one important way in which users have taken back control over their
9 online experiences is through third-party tools that operate solely at the users’ behest and in their
10 interest. These tools have allowed users to tailor their online experiences to their preferences and
11 to break out of the walled gardens of any particular online service.

12 30. Many of the browser and application features we now take for granted started with
13 third-party tools. For example, before major browsers allowed users to enable HTTPS-only mode,
14 a browser extension called HTTPS Everywhere enabled users to automatically default to the
15 HTTPS version of a website, making their browsing more secure. When websites became overrun
16 with pop-up ads, pop-up blocker tools like Pop-Up Stopper and Adblock emerged to help users
17 block the ads. As instant messaging exploded, a chat technology called ICQ surfaced to connect
18 users of different proprietary chat clients. And as users’ accumulated more online accounts,
19 password managers provided a way to collect and save user passwords to later automatically enter
20 and submit.

21 31. Today, third-party tools continue to enhance users’ online experiences. Email
22 clients have enabled users to customize their inboxes and block spam and other unwanted content.
23 Money management apps have allowed users to connect to bank and credit card accounts from
24 other providers and manage their personal finances in one place. Parental control tools allow
25 parents to restrict their children’s access to inappropriate or explicit content. Self-control tools help
26 users manage how much time they spend online by blocking or limiting their access to distracting
27 websites. Accessibility tools have improved the online reading experiences of people with visual
28 impairments. There are also transparency tools that help users better understand their online

environment. For instance, *The Markup*'s Blacklight tool automatically scans websites to notify users what user-tracking technologies are operating on any given website. And there are a number of third-party services that automatically scan websites to ensure that they are not vectors for phishing attacks or other kinds of fraud.

32. Third-party tools in this model are crucial to increasing user agency on social media. One can easily imagine tools that would empower users to curate their existing feeds according to alternative ranking, labeling, and content-moderation rules, for example, or tools that would allow users to access all of their social media feeds in one place.

33. Most of the major social media companies, however, have obstructed the creation of such tools. For example, they have tightly restricted the data that their users can access through "APIs"; they have adopted terms of service and developer policies that discourage accessing data outside these limited official channels; and they have sent legal threats to developers, even when those developers access user data only at their users' explicit direction.

34. Even companies that were previously more open to third-party interoperation no longer are. For example, in 2023, X Corp., formerly known as Twitter, updated its developer terms to ban app makers from creating their own "clients"—like Twitterrific and Tweetbot—which had allowed users to customize their platform experience. Then, the company ended access to its free API, replacing it with a prohibitively expensive pricing model that collapsed the once thriving ecosystem of third-party apps and tools that relied on it. Among the most prominent casualties was "Block Party," a popular anti-harassment service that helped users avoid harassing content on the platform.

IV. Plaintiff Ethan Zuckerman has a longstanding interest in empowering and informing users of online platforms.

35. Professor Zuckerman is a media scholar, software developer, and policy advocate who has dedicated his career to studying the civic and social roles of internet platforms. He is currently an associate professor at the University of Massachusetts Amherst, a faculty associate at Harvard's Berkman Klein Center for Internet and Society, and the director of the Initiative for Digital Public Infrastructure ("IDPI"), which he founded in 2021.

1 36. Prior to joining the University of Massachusetts Amherst, Professor Zuckerman
2 was the director of the Center for Civic Media at the Massachusetts Institute of Technology
3 (“MIT”) and an associate professor of the Practice of Media Arts and Sciences at the MIT Media
4 Lab. He is the author of two books, *Mistrust: Why Losing Faith in Institutions Provides the Tools*
5 *to Transform Them* (WW. Norton & Company, 2021) and *Rewire: Digital Cosmopolitans in the*
6 *Age of Connection* (WW. Norton & Company, 2013).

7 37. Professor Zuckerman’s recent research has focused on exploring alternative
8 business and governance models for the internet. He believes that the dominance of a small number
9 of social media companies tends to create the illusion that the business model adopted by them is
10 inevitable. By exploring different ways social media might work, Professor Zuckerman hopes to
11 broaden our collective imagination about the range of possible interventions.

12 38. Professor Zuckerman believes that third-party tools that operate at the explicit
13 direction of social media users are a particularly promising avenue for improving online
14 experiences. By employing such tools, users could exercise more control over their digital lives—
15 controlling how information is presented to them on the platforms and what information about
16 them is collected. For example, users could employ third-party tools to customize a platform’s
17 interface, to block content the platforms allow but that users would prefer not to see, and to
18 automatically update their privacy settings. Tools in this model would function like pop-up ad
19 blockers or instant messaging aggregators. In other words, they would carry out their users’ wishes,
20 operating as extensions or “agents” of the user.

21 39. Professor Zuckerman has helped build such tools before. For example, while he
22 was at MIT Media Lab’s Center for Civic Media, he was part of a small team that built “Gobo,” a
23 tool that allowed users to combine feeds from multiple social media accounts and decide which
24 posts to see. The team built Gobo to give users more control over their social media experiences—
25 instead of needing to access platforms individually, via the algorithms and user experiences that
26 the platforms provided, Gobo allowed users to compile their feeds from those platforms in one
27 place, and to impose their own rules and filters. For example, users could filter out content based
28

on certain criteria: seriousness, rudeness, virality, gender, and brands. Using a “politics” slider, they could also filter in more posts from news outlets they did not read every day.¹

40. Gobo showed users why each post was included in their feed and invited them to explore content that was filtered out by their current settings. Gobo was also designed to protect user privacy; it avoided unnecessary data tracking and always asked for consent for the data it had to collect. A pilot study the Gobo team conducted in 2019 received positive feedback from users, suggesting that Gobo had potential to enhance user control, transparency, and explainability in social media.

41. Gobo is just one of the many projects Professor Zuckerman has undertaken in his efforts to broaden society’s collective imagination about solutions to the challenges presented by our current online ecosystem. In 2020, Professor Zuckerman also led a team in building the special purpose platform “Smalltown.” It is a free, open-source platform (based on and compatible with Mastodon) that allows communities to create their own spaces for small-scale civic discussions. By making it easy to experiment with moderation tools and online spaces, Smalltown also puts control in the hands of individuals, letting community members customize the features of their online spaces without needing to know how to code.

42. Professor Zuckerman has also developed tools to enable other researchers to study the news and social media ecosystems. For example, in 2009, he co-founded Media Cloud, an open-source platform for analyzing the content of online media. Media Cloud allows researchers to map different topic areas across the internet, analyzing the level of influence pieces of media have, how they are discussed, and where they circulate. It has helped researchers study a range of issues, including natural disasters, elections, and the #MeToo movement.

V. Professor Zuckerman has designed a tool that would empower and inform users of Facebook, but has not released the tool due to fears of legal liability.

43. As a natural extension of this work, Professor Zuckerman has designed a tool that would increase users’ control over their Facebook experience, by allowing them to turn off their

¹ Gobo retrieved posts through platform-provided APIs; because Facebook’s API was particularly limited, Gobo accessed only public page content from that platform.

newsfeed—the endless stream of posts that users see when they log into the site. Professor Zuckerman has also designed a research study that would allow him to investigate the impact of using the tool on user behavior and well-being. Professor Zuckerman has not released the tool, however, because he is concerned that doing so will expose him to legal liability, as Meta has threatened the developer of a nearly identical tool in the past.

Facebook

44. Before describing Zuckerman’s proposed tool and research, it is helpful to explain how Facebook works.

45. Facebook is a social media platform that connects users with other users (“friends”), groups, and pages. With over two billion daily active users, it is reported to be the most widely used social media platform worldwide. (Professor Zuckerman is among Facebook’s many users. He joined the platform in 2007 and often notes that he and his wife were old friends who connected on Facebook in 2016 before dating.)

46. The newsfeed is the first thing that Facebook presents to its users when they log into the site. It is the constantly updating list of posts in the middle of a user’s homepage. Interspersed among these posts are ads, which look like ordinary posts, but are marked as “sponsored.” Ads are also located in a sidebar to the right of the feed.

47. According to Facebook’s Transparency Center, Facebook personalizes the newsfeed of each of its users using a machine-learning-powered system to rank content. The ranking system works in four basic steps:

- a. To start, it gathers a user’s “recent inventory”—all potential new posts, or posts with new activity, that a user could see when opening Facebook. This includes all posts from sources that a user has “followed”—that is, friends a user has added, pages the user has liked, and groups the user has joined—excluding content that has been flagged for violating Facebook’s community standards.
- b. Then, for each post, the system considers “thousands of ‘signals’ to make predictions about what [a user] will find most interesting.” These signals include what and whom a user has followed, liked, and engaged with recently, as well as

interests and traits that have been inferred based on actions the user has taken on the platform and off.²

c. Next, the system “use[s] these signals to make a series of personalized predictions about which content [users will] find most relevant and valuable.” For example, it predicts how likely it is that a user will comment on a post, that a user’s friends will comment on a post if the user shares it, or that a post will result in a back-and-forth discussion. It also predicts whether a piece of content is “problematic and should receive reduced distribution.”

d. Finally, the system uses all of these predictions to develop a “relevance score” for each post. This score is meant to reflect how interested a user is likely to be in a post. The system then ranks the posts by that score, and intersperses the posts with ads as well as recommended content from accounts that a user does not follow.

48. Today the newsfeed is central to Facebook, but it represented a seismic change in how users experienced social media when it was introduced in 2006. Previously, users navigated social media platforms manually, by explicitly choosing which friends and groups to connect with, and which posts and photos and news stories to seek out. Facebook is illustrative. It functioned as a directory of individual user profiles—users could update and personalize their own profiles, but, to see their friends’ updates, they had to search for their friends’ profiles.

49. The newsfeed changed this by automatically presenting to each Facebook user a stream of information in one central location. This had two major effects: first, no two users saw the same thing when they visited Facebook. (Although the newsfeed was initially ranked in reverse chronological order rather than algorithmically curated, each feed was unique because each user had a different set of friends, and so saw a different set of updates.) Second, the experience of users on Facebook became more passive, because users now encountered content primarily by scrolling

² Facebook tracks both its users and nonusers on other websites and apps using tracking technologies like Facebook Pixel. For example, a *New York Times* article reported that one user discovered the platform was tracking his activities on cancer treatment websites, collecting private details about his possible treatment options. Natasha Singer, *What You Don’t Know About how Facebook Uses Your Data*, *N.Y. Times* (Apr. 11, 2018), <https://perma.cc/C9AM-YYRQ>.

1 through feeds that Facebook compiled, rather than by seeking out content on their own. Though
 2 the introduction of the newsfeed initially provoked a backlash from users—many found it
 3 overwhelming and invasive—page views doubled, and engagement reached new heights. In fact,
 4 the newsfeed was so successful in boosting Facebook’s popularity that centralized feeds are now
 5 widely used across the internet, from X and TikTok to LinkedIn and Venmo.

6 50. Although Meta purports to give users the ability to control what they see in the
 7 newsfeed, in reality it is difficult for users to tailor the feed to their preferences. For example, in
 8 2022, Facebook introduced an alternative “Feeds” tab where users can access a reverse
 9 chronological feed that excludes recommended posts. Users cannot make this feed their default,
 10 however. Closing and re-opening the Facebook webpage or app will return users to their
 11 algorithmically ranked feeds, and even if a user selects the chronological feed in one Facebook
 12 session (like the mobile app), the user’s other sessions will still show the algorithmically ranked
 13 feed. It is therefore exceedingly difficult to opt out of Facebook’s algorithmically ranked feed.

14 51. Users also cannot easily opt out of Meta’s collection and use of data about their
 15 interactions with the newsfeed. According to Meta’s data policy, it collects detailed information
 16 about users’ Facebook usage, including “the types of content and ads that [users] view or engage
 17 with,” “the actions [users] take” (for example, whether they shared, commented on, or liked a
 18 post), and the “time, frequency, and duration of [users’] activities” (for example, how long a user
 19 spent on a post compared with other posts they have lingered on in their feed). Meta uses this data
 20 to, among other things, construct profiles of users and determine what content to show in their
 21 feeds. Facebook’s privacy settings do not enable users to opt out of this collection and use.

22 **How “Unfollowing” Works**

23 52. One important way in which Facebook users can limit which posts appear in their
 24 newsfeeds is to “unfollow” a friend, page, or group. Just as “following” a friend, page, or group
 25 results in their posts being included in the pool of content that may be featured in a user’s newsfeed,
 26 “unfollowing” removes their posts from this pool. As explained below, unfollowing is not the same
 27 as “unfriending,” because a user remains connected to friends, pages, or groups even after
 28 unfollowing them.

53. The process for unfollowing a friend, group, or page on Facebook is time-consuming because Facebook allows users to unfollow each friend, page, or group only manually, one at a time. The process for unfollowing has changed over time and will likely continue to change; however, it has remained burdensome, complex, and inconvenient in each iteration. At the time of filing, unfollowing can be accomplished in the following ways.

54. First, users can unfollow from their newsfeed by selecting the three-dot icon in the corner of each post in the feed, and then selecting “Unfollow” for the friend, group, or page that generated the post.

Figure 1. Unfollowing a friend through the newsfeed.

55. Second, users can unfollow through Facebook's menu system. The process is different for each category of content. To unfollow friends through Facebook's menu system, users can select "Friends," then "All friends," to access a list of their friends, and then they can select the three-dot icon for each friend and select "Unfollow." Users can also unfollow by navigating directly to a friend's page and selecting "Friends" and then "Unfollow."

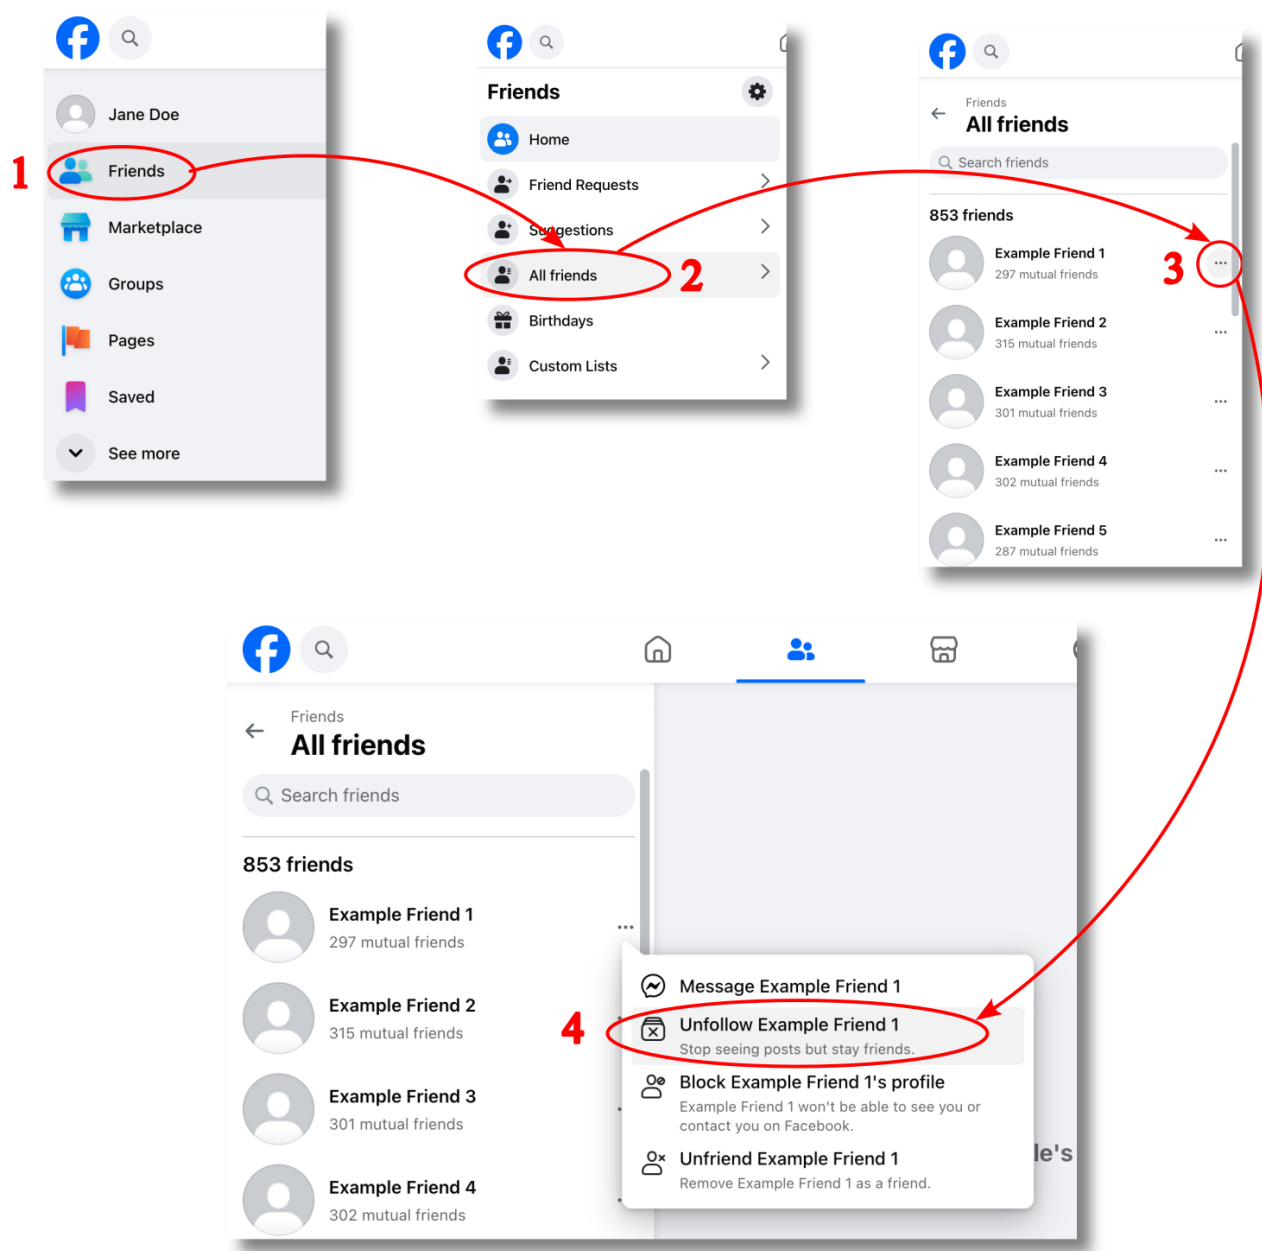

Figure 2. Unfollowing a friend through the menu system.

56. To unfollow groups through Facebook's menu system, users can select "Groups," and then "Your groups," to access list of their groups. The user can then unfollow each group, one by one, by selecting "View group" to pull up the group page, selecting the "Joined" dropdown menu at the top of the page, and then selecting "Unfollow group."

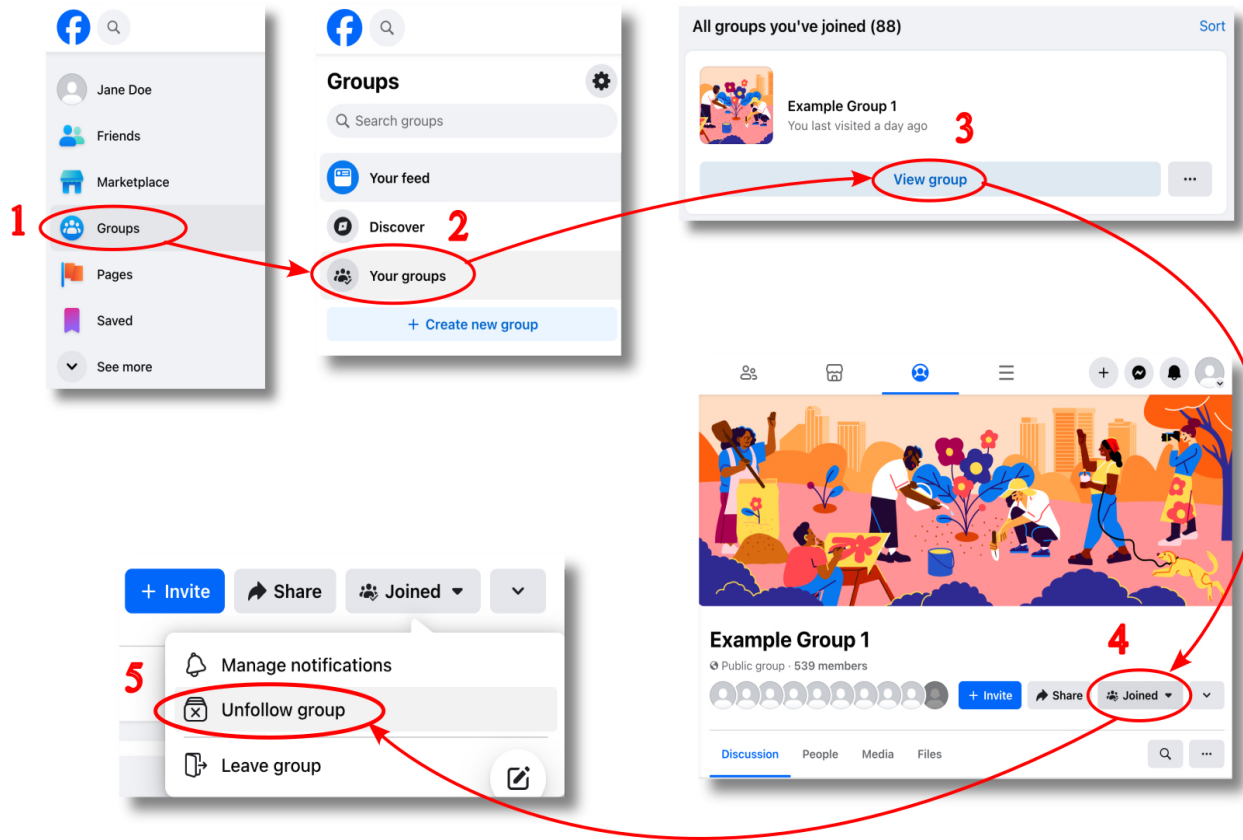

Figure 3. Unfollowing a group through the menu system.

57. To unfollow a page through Facebook's menu system, users can select "Pages," and then "Liked Pages." The user can then unfollow each page, one by one, by selecting the three-dot icon next to the name of each liked page, then "Follow settings," then "Unfollow this Page," and then "Update" to save the setting.

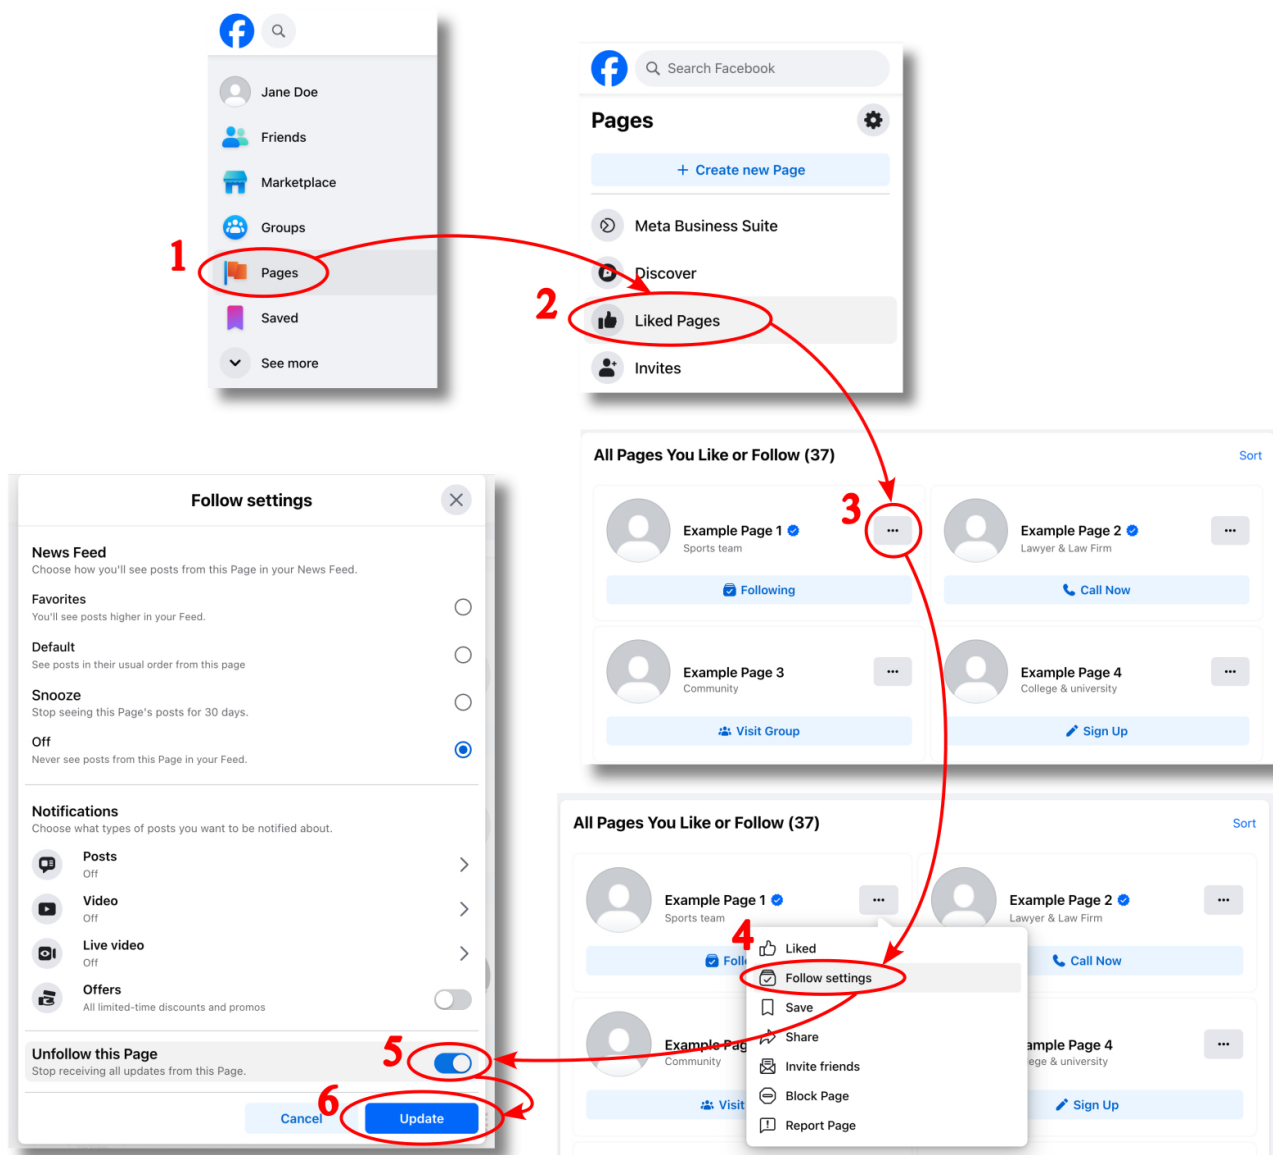

Figure 4. Unfollowing a page through the menu system.

58. Third, and finally, Facebook appears to be testing a feature that would allow users to unfollow a small group of friends, groups, and pages in a more streamlined way. To access this feature, a user can click their thumbnail photo in the top-right corner of their Facebook homepage, then “Settings & privacy,” then “Feed,” and then “Unfollow people and groups.” This will bring up a limited list of friends, groups, and pages, which appear to be among those the user has recently followed. The user can unfollow each by clicking a blue button to the right of the friend, group, or page’s name. However, this feature appears to give the user the ability to unfollow only a handful of recently followed friends, groups, and pages.

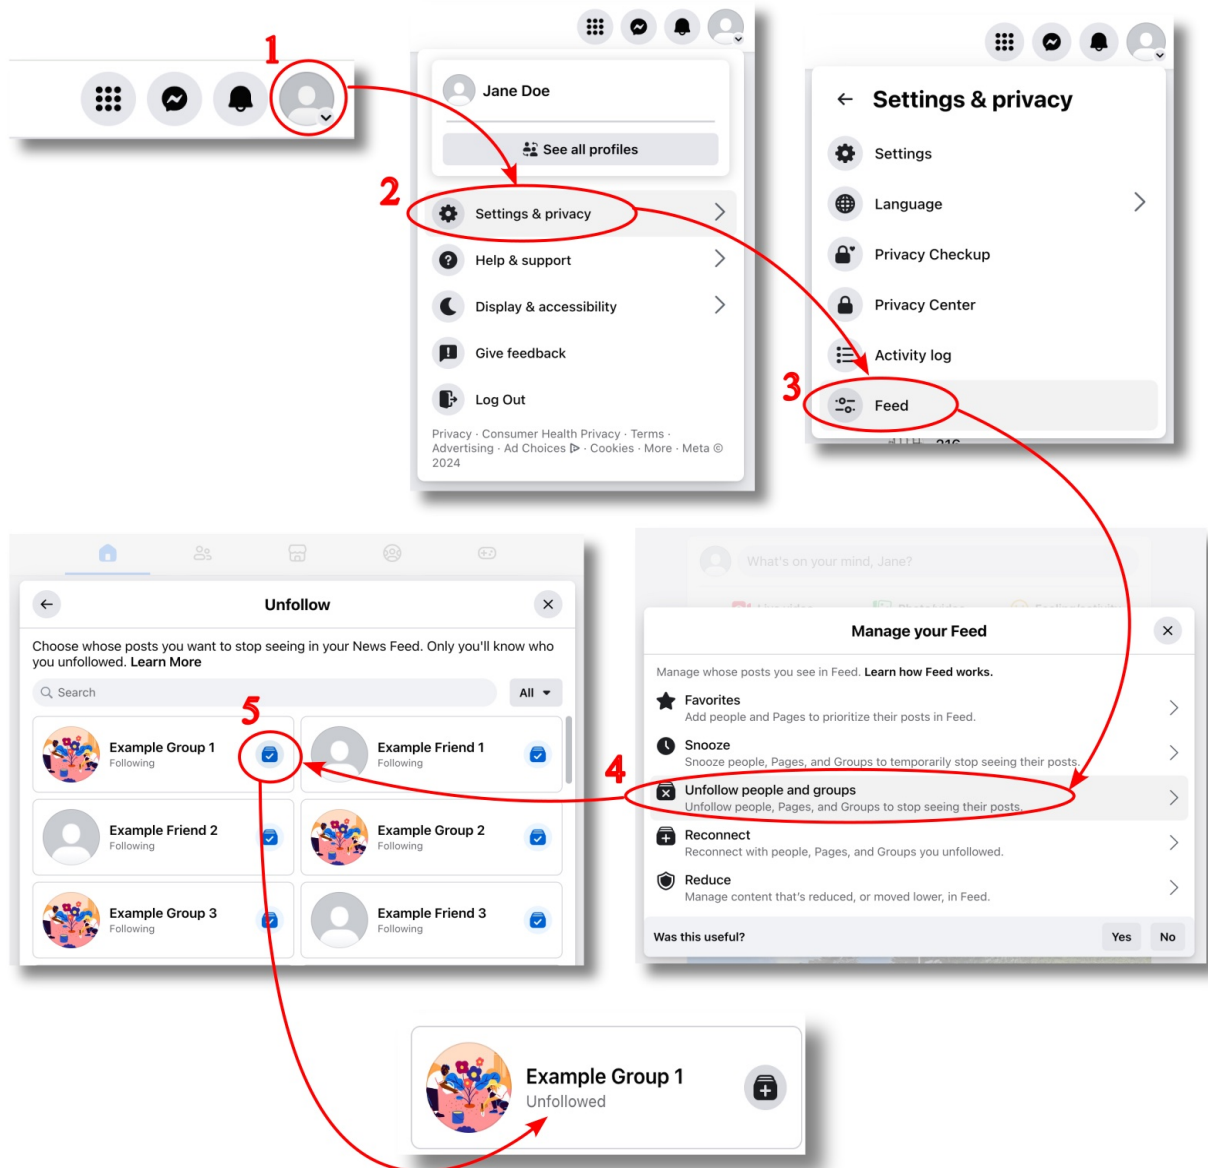

Figure 5. Unfollowing a limited list of friends, groups, and pages.

59. Unfollowing friends and groups works essentially the same way on both the web browser and the mobile app, though the names of certain menu items differ.

60. Unfollowing a friend, group, or page stops their posts and other activity from appearing in the newsfeed, but otherwise leaves the user's relationship with that friend, group, or page unaffected. A user who has "unfollowed everything" can still exchange messages and interact with the people and groups they have unfollowed, visit their pages, and see their posts.

61. Unfollowing all friends, pages, and groups leaves the user's newsfeed blank, or close to blank. Users can then choose to use Facebook without a newsfeed, navigating to the profiles and pages they want to see, or they can re-follow select accounts to build a newsfeed that is better tailored to their needs.

62. To re-follow, a user navigates to the relevant page and reverses the last few clicks in the unfollowing process.

Unfollow Everything 1.0

63. In 2020, one Facebook user, Louis Barclay, decided to unfollow all of his friends, pages, and groups in an effort to avoid the allure of Facebook's "infinite feed." Barclay spent days using Facebook's cumbersome interface to do so. According to an op-ed Barclay published in 2021, the effect of unfollowing everything was "near-miraculous." His use of Facebook declined dramatically "overnight," and he decided to develop a tool that would make the unfollowing process easier so that others could similarly take greater control of their newsfeeds. Barclay published the tool, called "Unfollow Everything," on the Google Chrome store, where users could download it for free. Thousands of people downloaded the tool.

64. Unfollow Everything worked by automating Facebook's existing unfollowing process. After downloading the plug-in, a user would log into Facebook using their Chrome browser. The tool would then automatically unfollow the user's friends, groups, and pages. The tool would start by causing the user's Chrome browser to retrieve a list of the user's friends, groups, and pages. The tool would then iterate through the list, causing the user's browser to send requests to Facebook to unfollow each friend, group, and page. Once Facebook confirmed that a friend, group, or page had successfully been unfollowed, the tool would move on to the next entry

1 on the list. All of this activity was controlled by the user's browser. To ensure that the tool worked
2 as intended, Barclay programmed it to report back to his own server a single piece of information:
3 the ratio of followed profiles to total profiles, which would be "0" for users of the tool who had
4 successfully unfollowed everything.

5 65. Unfollow Everything also had a public-interest research component. After users
6 started adopting the tool, Barclay worked with academics at the University of Neuchatel in
7 Switzerland to develop an optional research study concerning the impact of the newsfeed on the
8 amount of time spent on Facebook and the happiness of the platform's users. The academics
9 recruited two groups of Facebook users to participate in their study: one group of participants who
10 had used Unfollow Everything to eliminate their newsfeeds, and a control group of participants
11 who had left their feeds as is. Participants consented to sharing certain "limited and anonymous
12 information," specifically, "the amount of time they spent on Facebook, the number of times they
13 visited the site, and the number of friends, groups, and pages they were following and not
14 following, in total, and broken down by category."

15 66. Meta eventually forced Barclay to shut down Unfollow Everything and the
16 associated research study. In July of 2021, Meta (then Facebook) retained outside counsel at a
17 major law firm to send Barclay a cease-and-desist letter threatening him with legal action unless
18 he took the tool down. The letter informed him that his Facebook and Instagram accounts had been
19 permanently disabled and demanded that he never again create a tool that interacts with Meta's
20 products in any way. Fearing legal action, Barclay complied.

21 **Unfollow Everything 2.0**

22 67. In the fall of 2021, Professor Zuckerman learned about Unfollow Everything and
23 decided to recreate the tool to give users more control over their newsfeeds, and to research the
24 impact of this change on users' experience of Facebook.

25 68. Professor Zuckerman viewed the tool as fundamentally consistent with the
26 approach to social media he had studied and advocated for elsewhere. Specifically, it operated at
27 the explicit direction of its users to tailor their online experiences to their interests, rather than the
28

1 interests of the platforms. The tool also allowed users to participate in public-interest research that
2 would illuminate the effects of user control on their experiences of social media.

3 69. The tool—called “Unfollow Everything 2.0”—and research study that Professor
4 Zuckerman plans to conduct using the tool are both nearly ready to launch. As explained further
5 below, however, he has not launched either due to fear of legal action by Meta.

6 The Tool

7
8 70. The goal of Unfollow Everything 2.0 is to put users in control of what they see in
9 their newsfeeds. Like the original Unfollow Everything tool developed by Barclay, Unfollow
10 Everything 2.0 will be a browser extension that enables users to automatically unfollow all of their
11 friends, groups, and pages. The effect of this unfollowing is to empty out a user’s newsfeed, by
12 removing posts generated by the user’s friends, groups, and pages from the feed, as well as the ads
13 and recommended content that would otherwise be interspersed among these posts.

14 71. The extension will be available to download for free from both the Chrome and
15 Firefox stores. Users will be able to review a privacy policy explaining how Unfollow Everything
16 2.0 processes personal data before downloading the tool.

17 72. Much like the original Unfollow Everything tool, Unfollow Everything 2.0 will
18 work by automating a feature that Facebook already provides: the unfollow function. When a user
19 logs into Facebook on their web browser and activates the Unfollow Everything 2.0 plug-in,
20 Unfollow Everything 2.0 will cause the user’s browser to retrieve the user’s list of friends, groups,
21 and pages, and record whether those friends, groups, and pages are followed or unfollowed. The
22 tool will then iterate through the “followed” list, causing the user’s browser to send a request to
23 Facebook to unfollow each friend, group, or page on the list, until it has exhausted the list.

24 73. Unfollow Everything 2.0 has been designed to prioritize user control and privacy.
25 The tool will allow users to select friends, groups, and pages to manually re-follow, or to keep
26 their newsfeeds blank and view only content that they actively seek out. It will also encrypt each
27 user’s “followed” list before saving it locally on the user’s device, to allow the user to
28 automatically reverse the unfollowing process, at their convenience. Should a user elect to reverse

the process, the tool will decrypt the list, and cause the user's browser to send a request to Facebook to re-follow each friend, group, and page on the list. Unfollow Everything 2.0 will store each user's "followed" list only on the user's device—not on the cloud or anywhere external to the device. Users can also choose to uninstall the tool at any time.

74. Unfollow Everything 2.0 collects only users' own data. Meta has repeatedly stated publicly that users own the data that they share with Facebook, and are permitted to download this information and take it to another platform. Meta's account-information page also confirms that users own the data that Unfollow Everything 2.0 would collect. Specifically, the list of information users see when they navigate to "Access your information" includes "Your friends," "Your pages," and "Your groups," as well as "Who you've followed."

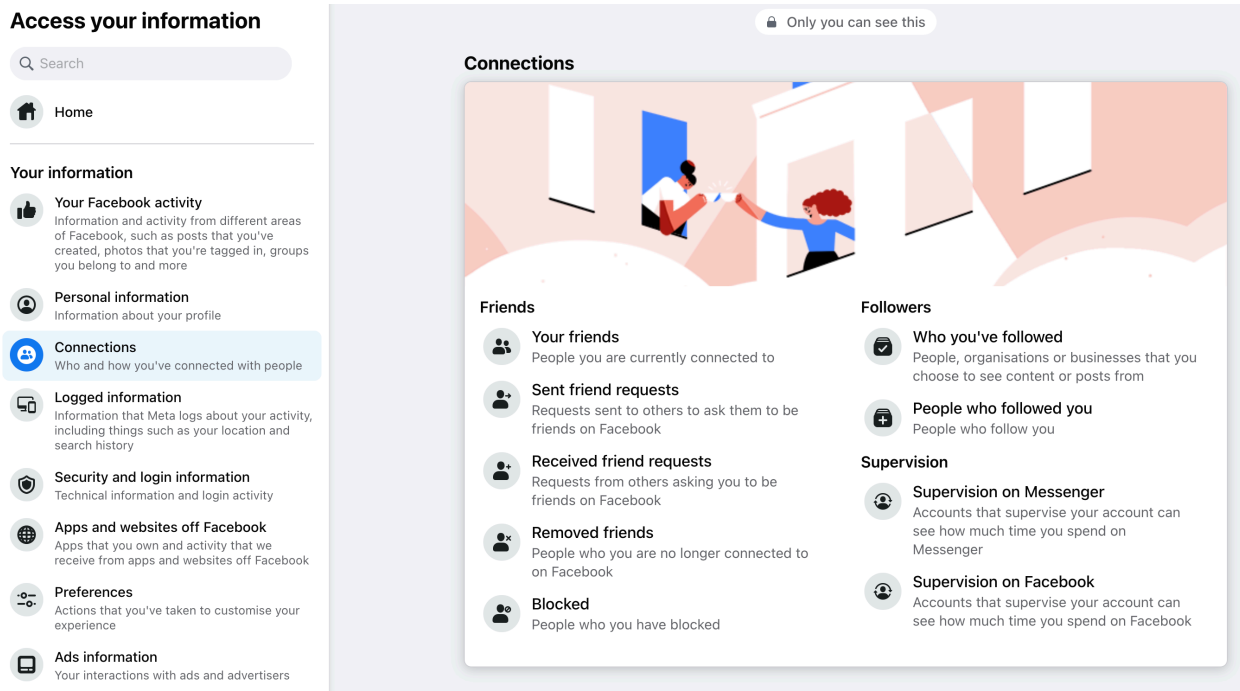

Figure 6. List of information shown when a user selects "Connections" on the "Access your information" page.

75. Unfollow Everything 2.0 has also been developed so as to not interfere with the normal operation of Facebook's platform. Once activated, the tool will send unfollow requests at controlled intervals, to complete unfollowing without burdening Facebook's servers. The same is true of re-follow requests, should a user elect to reverse the unfollowing process.

The Unfollow Everything 2.0 Study

76. Professor Zuckerman will conduct an optional research study to accompany Unfollow Everything 2.0, exploring how the newsfeed affects users' experience of Facebook. Users who choose to opt in will donate limited and anonymized data about their Facebook usage. They will also be asked to provide qualitative survey data about using Facebook without the newsfeed. The purpose of the study will be to examine the impact of turning off the feed on user behavior and well-being.

77. Professor Zuckerman plans to test four research hypotheses: (1) that users who access Facebook without the newsfeed will spend less time on Facebook, (2) that they will report a subjective feeling of increased control over their Facebook usage, (3) that they will not report a subjective feeling of decreased satisfaction in using Facebook, and (4) that they will be exposed to content from fewer friends in a browsing session and fewer friends overall. Even if these hypotheses turn out to be incorrect (and perhaps especially if they turn out to be incorrect), the study will help Professor Zuckerman, his team, and the public to understand critical aspects of user behavior online.

78. To test the study's research hypotheses, the Unfollow Everything 2.0 tool will switch participants between "feed off" and "feed on" conditions on a weekly basis. In the "feed off" condition, the tool will unfollow everything and leave users with a blank feed. In the "feed on" condition, the tool will re-follow all previously followed friends, groups, and pages to reinstate the user's newsfeed. The tool will log the amount of time each user spends on Facebook, as well as the number of unique accounts that a user views content from, for the duration of the study.

79. This information will be collected from the user's browser—not Facebook's servers. To track the amount of time a participant spends on Facebook, the tool will distinguish between browser tabs that are in focus and not in focus, and will log the amount of time that Facebook is in focus. To track the number of unique accounts from which a user encounters content, the tool will assign a unique, randomized number to each account whose posts the user encounters in their browser, and it will store that number in a table on the user's computer. At the

1 end of each session, the tool will tally the number of unique accounts encountered and send only
2 an aggregate count to Professor Zuckerman's study server. By comparing user behavior under the
3 "feed on" and "feed off" conditions, Professor Zuckerman will be able to test whether the first and
4 fourth hypotheses are true.

5 80. Participants will also be asked to complete a qualitative survey, answering
6 questions like, "Do you prefer Facebook's user experience after unfollowing everything?" "Do
7 you think you are spending less time on Facebook after unfollowing everything?" and "Would you
8 like to encounter Facebook posts from more or fewer people?" By reviewing participants' answers
9 to questions like these, Professor Zuckerman will be able to test whether the second and third
10 hypotheses are true.

11 81. Like Unfollow Everything 2.0 itself, the research study has been designed to
12 preserve user privacy. First, Unfollow Everything 2.0 will collect only a small amount of fully
13 anonymized data from those who volunteer to participate in the study. Participants will be assigned
14 a random identifier, so that they cannot be identified from study data. No Facebook usernames, IP
15 addresses, or any other personally identifying information will be collected. Second, the tool will
16 collect this anonymized data only from study participants; if another person accesses Facebook
17 using a different account on a participant's computer, their data will not be collected. Third, the
18 tool will not transmit any additional information about participants' friends, groups, or pages,
19 including their names or their content.

20 82. Professor Zuckerman plans to develop the results of the study into a research paper
21 to be published in a peer reviewed open access journal, meaning that its results will be available
22 to all study participants, to Meta, and to other scholars of social media. The study data will only
23 be used for non-commercial, public-interest purposes.

24 83. The Unfollow Everything 2.0 tool and accompanying research study are nearly
25 ready to launch. Professor Zuckerman has developed a detailed design for the tool in the form of
26 pseudocode—a blueprint addressing key questions of architecture and function that is used by
27 software developers as an immediate precursor to coding. And an academic cybersecurity expert
28 has reviewed the design and confirmed that the tool, if built to the specifications in the design, will

1 perform as expected and preserve the privacy of the tool’s users. Professor Zuckerman has also
2 developed the design of the associated research study. Before actually launching Unfollow
3 Everything 2.0, Professor Zuckerman must build the tool as designed and obtain approval for the
4 research study from his university’s institutional review board. Professor Zuckerman anticipates
5 applying for institutional review board review imminently, and he fully expects to receive
6 approval. He also anticipates being able to complete the tool within six weeks of a determination
7 from this Court that it would be lawful for him to launch the tool.

8 Fears of Legal Action

9
10 84. Professor Zuckerman has not actually launched Unfollow Everything 2.0 or the
11 associated research study because of the near certainty that doing so would put him at risk of legal
12 action. Professor Zuckerman fears legal action because Meta has a history of shutting down
13 research projects and tools like Unfollow Everything 2.0, including the tool on which Unfollow
14 Everything 2.0 is based.

15 85. As noted above, Meta (then Facebook) retained outside counsel at a major law firm
16 to send a cease-and-desist letter to the creator of the original Unfollow Everything tool. A redacted
17 copy of the letter, which the tool’s creator, Louis Barclay, made public on October 7, 2021, is
18 attached as Exhibit A. The letter claimed that Unfollow Everything “violate[d] Facebook’s terms”
19 by “automat[ing] actions on Facebook, including mass following and unfollowing of Friends,
20 Pages, and Groups.” The letter informed Barclay that he had been permanently banned from
21 Facebook and Instagram. It stated that any further activity by Barclay on those products would be
22 treated as “intentional and unauthorized access to its protected computer networks.” It also
23 demanded that Barclay immediately shut down the tool, delete any Facebook data associated with
24 it, and promise never again to create a tool that interacts with Facebook or Instagram.

25 86. The letter threatened Barclay with legal action if he did not agree to the company’s
26 demands. Specifically, the letter stated that, if Barclay continued to operate the tool, Meta would
27 “take whatever measures it believes are necessary to enforce its rights.” The letter also reserved
28 the company’s legal rights and remedies under “applicable domestic and foreign laws.” Meta

1 demanded a response from Barclay within 48 hours. Faced with the threat of serious legal action,
2 Barclay took down the tool.

3 87. Meta's lawyers then sent Barclay another letter. A redacted copy of that letter,
4 which Barclay also made public on October 7, 2021, is attached as Exhibit B. The letter informed
5 Barclay that he could request reinstatement of his Facebook and Instagram accounts if he
6 countersigned the agreement set out therein. Under the terms of this new agreement, Barclay would
7 be required not only to abide by Facebook's and Instagram's terms of service, but also to never
8 "again provide, market, publish, distribute, and/or offer any software code [he] had developed or
9 used to interact with the Facebook and Instagram websites and/or services . . . to any third-parties."
10 Meta would be entitled to recover not less than \$30,000, as well as reasonable attorney's fees, in
11 the event of a breach. The letter stated that it "[wa]s not intended by [Meta], and should not be
12 construed by [Barclay], as a waiver or relinquishment of any of [Meta]'s rights and remedies in
13 this matter." Barclay declined to countersign the new terms.

14 88. Meta has also issued legal threats to the developers of other similar browser tools
15 and research studies. For example, in the summer of 2020, Meta issued a cease-and-desist letter to
16 the operators of the popular web browser "Friendly," which allowed users to search their Facebook
17 newsfeeds by keyword, reorder their feeds chronologically, and customize the display of their
18 Facebook pages. Although Friendly has stated that its browser did not collect any personal
19 information from users or interact with Facebook's servers, Meta's letter threatened Friendly with
20 legal action for allegedly violating the platform's terms of service, the Computer Fraud and Abuse
21 Act ("CFAA"), and California's Computer Data Access and Fraud Act ("CDAFA").

22 89. In late 2020, Meta also issued a cease-and-desist letter to New York University
23 researchers Laura Edelson and Damon McCoy in response to "Ad Observer," a browser extension
24 they created to study disinformation on Facebook's platform. The extension collects the ads that
25 Facebook shows to users, along with limited and anonymous information about how advertisers
26 targeted the ads. Using this data, Edelson and McCoy have conducted important research into the
27 spread of disinformation through ads and other forms of paid promotion on Facebook's platform.
28

1 In August 2021, however, Meta suspended Edelson’s and McCoy’s Facebook accounts in response
2 to their failure to shut down the tool.

3 90. Because Meta has threatened enforcement against Unfollow Everything and many
4 other tools like it, it is all but certain that Meta would send Professor Zuckerman a cease-and-desist
5 letter if he released Unfollow Everything 2.0, and that such a letter would threaten legal action. It
6 is also likely that Meta would likely sue him for breach of contract and violations of the CFAA
7 and California’s CDAFA if he did not shut down the tool.

8 91. Professor Zuckerman is unwilling to subject himself and his team to the risk of
9 legal action. As such, he will not be able to launch Unfollow Everything 2.0 unless and until a
10 court rules that doing so would not violate Facebook’s terms of service, the CFAA, and
11 California’s CDAFA.

12 CAUSES OF ACTION

13 Count I

14 (Communications Decency Act, 47 U.S.C. § 230)

15 1. As relevant here, Section 230(c)(2)(B) of the Communications Decency Act
16 (“CDA”) provides immunity from civil suit (1) to any “provider . . . of an interactive computer
17 service,” (2) for “any action taken to enable or make available . . . the technical means to restrict
18 access to material” that either “the provider or user considers to be . . . objectionable.” 47 U.S.C.
19 § 230(c)(2)(B).

20 2. This provision would immunize Professor Zuckerman from civil liability for
21 designing, releasing, and operating Unfollow Everything 2.0.

22 3. First, in operating Unfollow Everything 2.0, Professor Zuckerman would qualify
23 as a “provider . . . of an interactive computer service.” The CDA defines the term “interactive
24 computer service” to include, among other things, an “access software provider that provides or
25 enables computer access by multiple users to a computer server,” *id.* § 230(f)(2), and it defines the
26 term “access software provider” to include providers of software and tools used to “filter, screen,
27 allow, or disallow content.” Professor Zuckerman would qualify as an “access software provider”
28 because Unfollow Everything 2.0 enables the filtering of Facebook content—namely, posts that

1 would otherwise appear in the feed on a user’s homepage. And he would “provide[] or enable[]
2 computer access by multiple users to a computer server” by allowing users who download
3 Unfollow Everything 2.0 to automatically unfollow and re-follow friends, groups, and pages; by
4 allowing users who opt into the research study to voluntarily donate certain data for research
5 purposes; and by offering online updates to the tool.

6 4. Second, Unfollow Everything 2.0 would enable Facebook users who download it
7 to restrict access to material they (and Zuckerman) find “objectionable.” *Id.* § 230(c)(2)(A). The
8 purpose of the tool is to allow users who find the newsfeed objectionable, or who find the specific
9 sequencing of posts within their newsfeed objectionable, to effectively turn off the feed.

10 **Count II**

11 **(Breach of Contract)**

12 5. Meta has taken the position that the original Unfollow Everything tool—a tool that
13 is materially similar to Unfollow Everything 2.0—violates the company’s Terms of Service,
14 including the Terms’ prohibitions on: collecting data from Meta’s products using automated
15 means, interfering with the integrity or operation of its services, and facilitating or encouraging
16 others to violate the Terms.

17 6. Unfollow Everything 2.0 would not, however, violate any of Meta’s Terms of
18 Service, and so it would not breach any contract between Professor Zuckerman and Meta.

19 7. First, Meta’s Terms apply only to a user’s “use of Facebook,” that is, activities the
20 user undertakes while logged in, but Professor Zuckerman will not be logged into his Facebook
21 account to operate the tool—users of the tool will. Second, Unfollow Everything 2.0 allows only
22 users of the tool—not Professor Zuckerman—to access their Facebook data using automated
23 means. Finally, Unfollow Everything 2.0 merely makes existing Facebook functionality more
24 convenient: it does not allow users to collect data they are not authorized to collect, it does not
25 allow users to take any other action they are not permitted to take, and it does not materially
26 interfere with the intended operation of Facebook.

1 **Count III**

2 **(Public Policy)**

3 8. To the extent Meta’s Terms of Service prohibit the operation of Unfollow
4 Everything 2.0, they are void for public policy because they violate federal and state public policy
5 favoring user control over their platform experience.

6 9. Section 230 of the CDA declares that it is “the policy of the United States” “to
7 encourage the development of technologies which maximize user control over what information
8 is received by individuals, families, and schools who use the internet and other interactive
9 computer services”; and “to remove disincentives for the development and utilization of blocking
10 and filtering technologies that empower parents to restrict their children’s access to objectionable
11 or inappropriate online material.” 47 U.S.C. § 230(b)(3)–(4).

12 10. This policy preference for user control is also reflected in the Supreme Court’s First
13 Amendment cases, which have treated user control as a less-restrictive alternative to direct
14 government regulation of online content. *See, e.g., Reno v. Am. C.L. Union*, 521 U.S. 844, 877
15 (1997); *United States v. Playboy Entm’t Group, Inc.*, 529 U.S. 803 (2000); *Ashcroft v. Am. C.L.*
16 *Union*, 542 U.S. 656 (2004).

17 11. California privacy law also reflects a policy in favor of user control, by codifying
18 users’ right to control the personal information that businesses collect about them, including how
19 that information is used to shape their platform experience. Specifically, the California Consumer
20 Privacy Act (“CCPA”), as amended by the California Privacy Rights Act (“CPRA”), and the
21 CCPA’s implementing regulations reflect a recognition that users should have “meaningful
22 options” over how their personal information is “collected, used, and disclosed,” CPRA § 3(A)(2);
23 that users and their “authorized agents” should be able to exercise these options “through easily
24 accessible self-serve tools,” including third-party browser plug-ins or extensions, *id.* § 3(A)(4);
25 and that platforms should not adopt design features that “subvert[] or impair[]” user control over
26 their data, Cal. Code Regs. tit. 11, § 7004(c); *see also* Cal. Civ. Code § 1798.140(h).

27 12. Unfollow Everything 2.0 promotes federal and state public policy favoring
28 increased user control over the platform experience. By allowing users to turn off their newsfeeds,

1 it would allow them to block content they would rather not see. It would also restrict Meta’s ability
 2 to use the data it would otherwise gather from users’ feeds to keep users on the platform for longer.

3 13. To the extent Meta’s Terms prohibit Unfollow Everything 2.0, the Terms violate
 4 federal and state public policy because Meta’s interest in enforcing the Terms are clearly
 5 outweighed in the circumstances by the public policy against enforcement of the Terms.

6 **Count IV**

7 **(Computer Fraud and Abuse Act, 18 U.S.C. § 1030)**

8 14. Operating Unfollowing Everything 2.0 also would not violate the CFAA, which
 9 prohibits “intentionally access[ing] a computer without authorization or exceed[ing] authorized
 10 access, and thereby obtain[ing] information from any computer.” 18 U.S.C. § 1030(a)(2)(C).

11 15. If Unfollow Everything 2.0 permits anyone to “access” Meta’s computers, it is
 12 users of the tool, not Professor Zuckerman. Users who download the tool would do so for the
 13 express purpose of taking advantage of the tool’s functionality—that is, to turn off or curate their
 14 newsfeeds, or to contribute to public-interest research about the platform and its effect on user
 15 behavior and well-being. The tool is designed to run on users’ computers, and it would
 16 communicate with Meta’s computers only at users’ explicit direction.

17 16. Even if Professor Zuckerman could be said to be accessing Meta’s computers
 18 through the tool, he would be doing so “with authorization.” He would be accessing only data that
 19 users themselves are permitted to access, and he would be doing so as the users’ “agent.” *See* Cal.
 20 Civ. Code § 2295. That is, he would be acting with users’ permission, at their direction, and in
 21 their interest, and the CFAA does not prohibit a person from collecting information to which they
 22 have lawful access, even if the specific method of collection is prohibited by the terms of use.

23 **Count V**

24 **(Computer Data Access and Fraud Act, Cal. Penal Code § 502)**

25 17. Operating Unfollow Everything 2.0 would not violate California’s CDAFA for the
 26 same reasons that it would not violate the CFAA. Unfollow Everything 2.0 permits users to access
 27 and use their own data; it does not allow users to access any Facebook data they are not entitled to
 28 access. It also acts only as users’ agent.

PRAYER FOR RELIEF

Plaintiff respectfully requests that this Court:

- A. Declare that Section 230(c)(2)(B) of the CDA immunizes Plaintiff from all civil claims and liability under breach of contract, the CFAA, and CDAFA in relation to Unfollow Everything 2.0;
- B. In the alternative, declare that:
 - a. The tool does not violate Facebook's terms of service, or Meta's Terms are void for public policy as applied;
 - b. The tool does not violate the CFAA; and
 - c. The tool does not violate the CDAFA;
- C. Permanently enjoin Meta from bringing claims against Plaintiff under breach of contract, the CFAA, and CDAFA in relation to the tool; and
- D. Grant such other and further relief as the Court may deem just and proper.

DATED: May 1, 2024

Respectfully submitted,

/s/ Max Schoening
